DETAILED ACTION

In view of the appeal brief filed on 1/05/2008, a conference has been held. The rejection is withdrawn and a notice of allowance is being attached.

Allowable Subject Matter

The following is an examiner's statement of reasons for allowance:

The prior art fails to show a method of activating call forwarding for a mobile station, comprising the steps of : monitoring a measure of received signal strength at said mobile station, the measure of received signal strength being of a signal transmitted between a base transceiver station of a cellular wireless telephone network and the mobile station; automatically transmitting a first feature code from said mobile station to a wireless network when said monitored measure of received signal strength falls below a threshold level, said first feature code activating call forwarding for said mobile station such that incoming calls are directed to a separate device associated with a previously programmed directory number; continuing to monitor signal strength of a signal transmitted between the base transceiver station and the mobile station at said mobile station during a period when call forwarding is activated; and automatically transmitting a second feature code from said mobile station to a wireless network when said signal strength rises above said threshold level, said second feature code deactivating said call forwarding.

The prior art fails to show a wireless telephone comprising: circuitry monitoring a measure of received signal strength from a base transceiver station of a cellular wireless telephone network; programmable logic providing instructions for automatically

Art Unit: 2617

transmitting a first feature code from said wireless telephone to a wireless network activating call forwarding when said circuitry determines that the received signal strength of a signal transmitted between the base transceiver station and the mobile station falls below a threshold level; and programmable logic providing instructions for automatically continuing to monitor the received signal strength from a base transceiver station of a cellular wireless telephone network after the first feature code is transmitted and for transmitting a second feature code from said wireless telephone to a wireless network deactivating call forwarding when said circuitry determines that the received signal strength, having previously fallen below a threshold level, rises above said threshold level.

Accordingly, Applicant's invention is allowed for these reasons and the reasons recited by Applicant in Amendments and Appeal Brief.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
